I don't know if AutoCAD has made you more or less productive, but I know it has enhanced my capacity to be more productive. AutoCAD was the reason I switched from custom software to the off-the-shelf Autodesk products. AutoCAD is the reason why I didn't rush to learn other design applications. I started working with AutoCAD in 1983, and by the mid-1990s, AutoCAD was the core of my small business. Since my retirement in 2012, I've worked with AutoCAD only on casual basis and have used other applications on a regular basis. My first exposure to AutoCAD was in 1983. I was a newly hired engineer at a large engineering firm, and I was tasked with plotting out the site plans of a new office building. We had a laser printer at the office and when I was given the task, I brought my ancient 1 MHz 386 personal computer to the office and used our shared printer to draw the plans. By the time I got back to the office, the plans were printed, but I had to take them back home and plot them on a big 11 x 17 sheet of paper. Today, the 3D CAD programs are almost ubiquitous. As a result, one would assume that all engineering firms, and any manufacturing operations have CAD. In practice, this is not the case. There are still engineering firms, and manufacturing operations that use paper drawings. Most of these drawings are still done by hand. Even if they are produced digitally, these hand-drawn images are scanned to provide some sort of drawing viewer that is viewed by someone at the drawing station who then traces the image into a CAD application. Even among engineering firms that do CAD, it is not unusual to have huge swathes of a project that are still done by hand. This is especially true in architecture. I've seen drawings that are hand drawn with no digitization. I've even seen some that are hand drawn on a sheet of carbon paper and scanned back in. I've even seen drawings where a three-dimensional CAD model was printed out with plans on one side and elevations on the other. This is where AutoCAD really shines. I was given the task to produce site plans, elevation plans, and 3D buildings. AutoCAD was a lifesaver. The site plans could be sketched out on the screen and

Other AutoCAD applications include cadenet: used in the autoCAD engineering suite: an industrial design software. It allows users to design, control and produce their own 3D physical objects and their related products such as packaging, tooling, moulds, and accessories. It can also create virtually any type of product, from engines to prosthetics, and anything in between. Other CAD applications include Cad-A, Cadcorp 3D, Cad-eDesign 3D, DCC System, Fireworks and Revit. The cloud-based cadApp360 is based on the 3D design and modeling software AutoCAD. Other applications include cadApp 360.
